Executive Summary

*What is the danger of highly pathogenic avian influenza?*

The Asian H5N1 strain of highly pathogenic avian influenza (HPAI), or bird flu, is primarily a disease of domestic poultry that is not native to North America. At the time of this writing, H5N1 is not known to be present in North America; however, outbreaks of HPAI in other parts of the world and the likelihood of continued spread, has heightened concern in the United States.

Should HPAI be introduced to the U.S., potential exists to impact NPS in three primary ways. The first and most likely impact will be to wildlife, primarily migratory birds. Management of domestic fowl maintained for cultural scenes would also be impacted. Further, humans can be exposed to and contract this illness by contact with birds, placing some NPS employees and possibly visitors at risk. In addition, if the virus adapts so that sustained human to human transmission occurs, it is possible that NPS would be faced with participation, along with local, state and federal health officials, in controlling the spread of this agent among people.

*What is in this Response Plan?*

This Response Plan recommends actions to be taken at the park level if HPAI occurs in North America and is close enough to an NPS unit that restrictions are imposed on animal movement, management, or on park visitors. The Plan addresses two different circumstances: first, if a park is within a USDA-defined Surveillance Zone and second, if a park is within a USDA-defined Control Area (Infected Zone or Buffer-Surveillance Zone). The level of response will also vary based on the number of cases that have occurred previously, i.e., the first several detections may be of highest concern.

*What to do if an NPS unit is in a highly pathogenic avian influenza Surveillance Zone.*

A Surveillance Zone is delineated by USDA Animal and Plant Health Inspection Service to monitor for disease spread beyond a Control Area. The HPAI coordinators, assigned for each park and region, should identify what resources in the park may be affected.

Communication with other agencies, particularly the USDA APHIS and the state veterinarian, is critical. The HPAI coordinators should consult their park-specific list of appropriate local contacts. Information should be provided to all employees and the public.

In consultation with the HPAI coordinator and park management, NPS units may conduct increased disease surveillance in wildlife and remove poultry and domestic fowl as outlined in this Plan.

*What to do if an NPS unit is in a highly pathogenic avian influenza Control Area.*

If highly pathogenic avian influenza is confirmed in an NPS unit, or the park is within a USDA-defined Control Area (Infected Zone or Buffer-Surveillance Zone), park staff should analyze the situation and order an Incident Management Team if this is among the earliest North American disease detections. Should HPAI become common or endemic in North America, NPS subject matter experts may be consulted for assistance.

The HPAI incident should be managed in accordance with enabling legislation, agency policies, park purpose and significance, and management goals.
Introduction

BACKGROUND

**Historical and Scientific Information**

The Asian H5N1 strain of highly pathogenic avian influenza (HPAI), or bird flu, is primarily a disease of domestic poultry that is not native to North America. At the time of this writing, H5N1 is not known to be present in North America; however, outbreaks of HPAI in Asia, the Middle East, Europe, and Africa, and the likelihood of continued spread to other parts of the world, have heightened concern in the United States. The Federal government response to HPAI is tiered from the Homeland Security Council’s National Strategy for Pandemic Influenza (http://www.pandemicflu.gov/plan/). NPS response is further tiered from the Department of the Interior Pandemic Influenza Preparedness and Response Plan.

Outbreaks of highly pathogenic avian influenza subtype H5N1 have been occurring in poultry in Southeast Asia since 2003. Wild birds, particularly waterfowl and shorebirds, commonly carry low pathogenicity avian influenza viruses without harm. However, the Asian H5N1 HPAI virus has mutated and adapted to cause illness and death in domestic and wild birds, and has also affected a limited number of mammals, including humans. Worldwide, mortality from the virus has been detected in more than forty species of free-ranging birds including swans, ducks, geese, gulls, birds of prey, and some peridomestic species such as sparrows and corvids (view full list at http://www.nwhc.usgs.gov/disease_information/avian_influenza/affected_species_chart.jsp). Over 200 million domestic birds in the affected countries have died or been culled in attempts to control the disease. In humans, the death rate from reported HPAI cases to date has been about 50%; however, case mortality in a pandemic has been projected in the U.S. National Strategy for Pandemic Influenza (2005) to be <2%.

The virus is spread among birds in fecal droppings, saliva, and nasal discharges. The virus is quite easily inactivated by disinfectants but can survive for long periods (a month or more) in cold water. HPAI has been detected in some apparently healthy wild birds. The role of migratory birds in spread of the disease is likely, although human assisted movement of poultry or poultry products are also important transmission pathways. The impact of HPAI on wild bird populations is unknown. More clear is that HPAI poses a significant economic threat to domestic poultry and fowl operations and to human health.

If HPAI were identified in poultry or other domestic fowl in the United States, regulatory agencies (e.g., USDA APHIS) would respond with immediate culling of domestic birds within a predetermined radius of the case (the “infected zone”). Stepped-up surveillance, movement restrictions, and perhaps a zonal ring of vaccination of domestic birds, in facilities surrounding the outbreak would supplement disease control efforts. Although culling domestic birds to contain the spread of HPAI is considered an acceptable agriculture practice, culling of migratory birds is likely ineffective in disease control and would have unknown and potentially significant ecological consequences. Further, culling migratory birds is not recommended as an HPAI management action by the Food and Agriculture Organization of the United Nations (FAO) or World Health Organization (WHO), the two leading international health authorities.
Most human cases have occurred from contact with infected poultry or contaminated surfaces. To date, spread of H5N1 virus from person to person has been rare and spread has not continued beyond one person. However, because all influenza viruses are genetically unstable and have a tendency to change, scientists are concerned that the Asian H5N1 virus could one day be spread easily from one person to another. If the virus were able to infect people and spread easily from person to person, an influenza pandemic could begin.

Therefore, should HPAI be introduced to the U.S., potential exists to impact NPS in three primary ways. The first and most likely impact will be to wildlife, particularly migratory birds. Management of domestic fowl maintained for cultural scenes would also be impacted. Further, humans can be exposed to and contract this illness by contact with birds, placing some NPS employees and possibly visitors at risk. Additionally, if the virus adapts to achieve sustained human to human transmission, it is possible that NPS would be faced with participation, along with local, state and federal health officials, in controlling the spread of this agent among people.

National Park Service Management Considerations

Park managers have an opportunity to consider potential disease response actions before an outbreak occurs in North America. This plan considers the following:

- Potential impairment of park resources, including actions recommended for disease control.
- Viable populations of wildlife and plants in parks, in accordance with each park’s purpose and significance.
- Visitor experiences in parks, in accordance with each park’s purpose and significance.
- Maintenance of visitor and employee health and safety.
- Economic loss to communities and the private sector from either animal destruction or travel restrictions.

PURPOSE OF THIS PLAN

General Purposes

Should highly pathogenic avian influenza be detected in or near a park, that park is likely to be involved in a coordinated response with other agencies. Many of these agencies will want decisions made immediately and actions taken quickly. Therefore, adequate preparedness is critical (See Preparedness and Communication Plan).

The primary purpose of this National Park Service Highly Pathogenic Avian Influenza Response Plan is to provide guidance for park managers and staff in the event of an outbreak near a park. This plan can help park managers consider the impacts to park resources and visitor experiences that proposed actions could cause.

The Incident Command System is ideally suited for managing complex situations, including those involving multiple jurisdictions and agencies. This plan provides
information, prototypes, and samples of incident management materials that can assist parks and incident responders in properly managing a highly pathogenic avian influenza incident.

**Relationship with Policy and Compliance**

This plan is not intended to establish or modify NPS or individual park policy. This plan should be considered "highly recommended advice" to parks. The applicability of legal constraints and obligations, policy requirements, applicable definitions (such as impairment) and strategic management goals must be considered when planning actions.

**HOW TO USE THIS PLAN**

To assist NPS parks and regions address highly pathogenic avian influenza, two sets of plans have been developed. The NPS Wildlife Plan includes a Preparedness and Communication section and Response section. The NPS Pandemic Influenza Plan, which addresses the situation when sustained human to human transmission occurs, follows the Wildlife Plan. The decision tree below can be used to determine the appropriate level of action based on the current situation. Note that as long as an increased risk from HPAI occurs in the United States, action should be taken starting with Step 1 of the Wildlife Plan Preparedness and Communication section and continuing through the appropriate portion of the “plan” and “step” identified in the decision tree.

Information on the geographic distribution, species affected, impacts, and appropriate response to HPAI is dynamic and continues to change and expand. Updated information to support these plans will be posted on the NPS website at [http://www.nps.gov/public_health/zed/ai/ai.htm](http://www.nps.gov/public_health/zed/ai/ai.htm).
**Highly Pathogenic Avian Influenza Virus Decision Tree.** This decision tree indicates the Plan and Step at which each situation is addressed. Note that steps are progressive in the Wildlife Plan Preparedness and Communication section and, regardless of current situation, if risk exists action should begin at Step 1 of the Preparedness and Communication section of the Wildlife Plan.
ACTION FLOWCHART for Moving Through the Preparedness and Communication Plan and Response Plan

• This action flowchart has been developed to assist or provide guidance to managers in determining when or whether to move from the HPAI preparedness and communication planning stage to the HPAI response stage. This decision is based on the current situation in the area of the park. The process starts with the preparedness and communication plan which is a limited measured response designed to provide park managers with the necessary information to identify and implement appropriate management actions and concerns.

• Park Managers should be advised that should a suspect or confirmed case of HPAI be identified in or adjacent to the United States that the USDA, Animal and Plant Health Inspection Service may establish Control Areas and Surveillance Zones which may include units of the National Park Service. Should such Control Areas or Surveillance Zones be established by APHIS, NPS units may be required to go directly to implementing all or portions of the NPS Response Plan. In order to establish and maintain a measured response, communications between NPS and cooperators is essential.
Situation: A highly pathogenic avian influenza virus is identified that has the potential to enter the North American continent, Hawaii, and U.S. Territories through domestic animals, wildlife, humans, contaminated material, or other means.

- **NO** No Action Required
- **Yes** Implement the Preparedness and Communication Plan.
  - Step 1. Establish regional and park coordinators for HPAI Management.
  - Step 2. Establish contacts with cooperating federal and state agencies and other appropriate entities.
  - Step 3. Provide targeted employee information and training, provide visitor and concession information as requested.
  - Step 4. Conduct a HPAI Management Assessment (Resource Risk Assessment)
    - Identify species at risk, i.e., T&E or unique species, waterfowl and shorebirds.
    - Identify high priority species for surveillance.
    - Identify congregations, home ranges, and population estimates for high priority species.
    - Identify poultry/domestic fowl in and near to park boundary.
    - Identify feral and exotic avian species that may increase risk to native birds.
    - Identify park and public use types
    - Identify possible park restrictions or closures that may be required or desired

If disease surveillance results in detection of a suspected highly pathogenic avian influenza virus in the park or if the park is included in a USDA -defined Control Area or Surveillance Zone -- **INITIATE THE RECOMMENDED NPS RESPONSE PLAN.**
Situation: Highly pathogenic avian influenza is confirmed to be present in the North American continent, Hawaii, or U.S. Territories or migratory birds arrive via affected flyway.

- Review the HPAI Management Assessment in light of the facts specific to the outbreak.
- Proximity to park boundary or affected flyway
- Cooperation with other agencies and their actions
- Consider additional proactive park, public, and other agency information and education

- Step 5. Contact cooperating agencies and other appropriate entities.
- Step 6. Increase information flow to employees, visitors, and partners.
- Step 7. Implement preventative management activities.
- Step 8. Implement disease surveillance.
- Assess the situation and, in coordination with cooperating agencies identify the need for additional actions.

- If disease surveillance results in detection of a suspected highly pathogenic avian influenza virus in the park -- INITIATE THE RECOMMENDED NPS RESPONSE PLAN.
- If this is an initial detection in the geographic area, request an Incident Management Team.

- If the park is within a USDA-defined Control Area or Surveillance Zone -- INITIATE THE RECOMMENDED NPS RESPONSE PLAN.
- If this is an initial detection in the geographic area, request an Incident Management Team or appropriate subject matter experts.
PREPARATION

REFERENCE MATERIAL FOR DETECTING HIGHLY PATHOGENIC AVIAN INFLUENZA

Introduction

Worldwide, mortality from the virus has been detected in more than forty species of free-ranging wild birds including swans, ducks, geese, gulls, birds of prey, and some peridomestic species such as sparrows and corvids (view full list at http://www.nwhc.usgs.gov/disease_information/avian_influenza/affected_species_chart.jsp). Five surveillance strategies have been identified for collecting monitoring and surveillance data on H5N1 virus in wild birds (Appendix 1). Morbidity and mortality surveillance is the principal surveillance method that will be implemented by NPS and, therefore, the only strategy discussed here.

The systematic investigation of morbidity and mortality events in wild birds to determine if H5N1 is playing a role in causing illness and death offers the highest and earliest probability of detecting the virus if it is introduced by, or to, migratory birds in the U.S. It is important to emphasize that morbidity and mortality events in wild birds can be due to a variety of causes. Diagnostic testing is required to determine cause of death and to refute or confirm infection with HPAI. Further, the detection of an avian influenza virus is not of concern unless it is a highly pathogenic strain, specifically in this case the Asian H5N1 strain. Avian influenza viruses occur naturally in birds, particularly birds that live on and around water. Most of these viruses are of low pathogenicity and cause no harm to the host and no threat to other species.

Prioritizing Surveillance Actions

Prioritization of investigation of morbidity and mortality events may vary somewhat with location. But there are two general approaches: identification of unusual mortality events and surveillance of priority species.

Unusual mortality events are wildlife deaths that occur outside the range that is usually observed. Professional judgment, historical knowledge of the areas, and consultation with disease experts may be used to make the determination. Unusual mortality events can take different forms, including increased numbers found dead, duration of mortalities over time, or mortality that occurs at a different place or time of year than expected. Generally, a single dead bird does not constitute an event, however, this observation may initiate monitoring for additional mortalities.

Priority species may be defined as those migrating in from areas where HPAI occurs, or that are of greatest risk of disease. A system for ranking priority species is presented in the Early Detection System for Asian H5N1 Highly Pathogenic Avian Influenza in Wild Migratory Birds—U.S. Interagency Strategic Plan (http://www.nps.gov/public_health/zed/ai/ai.htm). A preliminary list of priority species for HPAI surveillance is included in Appendix 1; however, work is continuing on refining and revising these lists. Based on observations in Europe, it appears that swans are commonly some of the first birds
found dead and diagnosed with HPAI. Therefore, swans may be considered a priority species for surveillance.

**Surveillance Planning and Implementation**

Actions necessary to plan and implement morbidity and mortality surveillance for HPAI are summarized in Table 1.

**Table 1. Components of HPAI surveillance and detection activities.**

</tr>
</tbody>
</table>

Acquisition of necessary permits from the U.S. Fish and Wildlife Service and completion of National Environmental Policy Act (NEPA) compliance documents should be considered during the planning process. Director’s Order 12 includes a categorical exclusion [CE 3.4E(3)] for:

“Removal of individual members of a non-threatened/endangered species or populations of pests and exotic plants that pose imminent danger to visitors or an immediate threat to park resources.”
In order to use the above CE appropriately, there are certain conditions and parameters that must be met. Most importantly, that there are no exemptions to the CE and that an Environmental Screening Form is completed.

Human health protection is a critical element in HPAI surveillance. Appropriate protection of employees and visitors against exposure to HPAI should be followed and will vary with the level of risk (Appendix 2). Personal protective equipment (PPE) and other sampling equipment should be available for response to morbidity and mortality events (Table 2). Only employees trained in wildlife mortality investigation or in direct contact with experts providing direction should handle animal carcasses.

Table 2. Equipment necessary for wildlife mortality event response.

Carcasses can be submitted to the National Wildlife Health Center (NWHC) in Madison, Wisconsin or other laboratories approved for detection of HPAI. Instruction forms for sample submission to the NWHC (and also useful for other labs) are included in Appendix 3. If samples will be submitted to other laboratories, check ahead of time to confirm that submissions will be accepted.

Surveillance should be continued, and likely expanded, after detection of HPAI H5N1 is made in an area. The type of surveillance methods used may be increased beyond morbidity and mortality investigation (Appendix 1). Surveillance may also be broadened to include a wider range of species, including associated avian and mammalian species (specifically carnivores).
## Situations and Actions

### INITIAL RESPONSE: WHAT TO DO IF AN AVIAN INFLUENZA VIRUS IS DETECTED

**DEFINITION:** Detection of any avian influenza virus in a park may trigger initial steps of the Response Plan. However, wild birds commonly carry non-pathogenic strains of avian influenza which, unlike H5N1, are not cause for concern. Confirmatory tests are needed to determine if the strain detected is the Asian H5N1 of concern.

**CONSIDERATIONS:** While awaiting results of laboratory tests to define the avian influenza virus strain detected, park staff is encouraged to implement initial steps of the Response Plan to prepare for response if necessary and to provide transparent communication with partners and the public.

### RECOMMENDED ACTIONS

#### STEP 1: Contact the appropriate animal health officials and cooperating agencies.

If a laboratory detects a suspect H5N1 avian influenza virus in a sample from a park, communication will proceed according to the Department of the Interior Pandemic Influenza Preparedness and Response Plan. Upon notification, the park may contact:

1. Appropriate HPAI coordinators
2. State veterinarian’s office (Appendix 5)
3. USDA APHIS area veterinarian-in-charge (AVIC) (Appendix 5)
4. State wildlife agency (Appendix 5)

NPS, DOI, and APHIS may dispatch disease specialists to investigate.

#### STEP 2: If the avian influenza virus detection was from a mortality event, secure the area in accordance with the instructions of the experts contacted in step 1.

Use personal protective equipment and good hygiene practices when handling an HPAI suspect animal. Follow directions of the experts for protecting your health, securing the area, handling and disposing of carcasses, and disinfecting. If possible, simply monitor the area to keep visitors and animals away from the carcasses until trained assistance arrives. Use caution to minimize possible contamination of equipment, vehicle, or yourself with the virus and follow-up with disinfection and avoidance of other susceptible animals.

#### STEP 3: Coordinate initial actions with cooperating agencies.

The DOI and APHIS disease experts will combine initial laboratory test results with history, presentation, and professional experience to classify the suspect as unlikely, possible, or highly likely. Based on this classification and in consultation with the state
veterinarian’s office and APHIS AVIC, recommendations will be made to the park. Strongly consider implementing these recommendations until diagnostic tests refute or confirm HPAI.

Begin additional planning by reviewing the Incident Information Checklist and Strategy (Appendix 4). Begin consideration of what the Incident Objectives and Strategies (Appendix 4) might be. Note that there are no data to suggest that culling migratory birds is an effective means to control HPAI. Neither the World Health Organization or the Food and Agriculture Organization of the United Nations recommend culling migratory birds to manage the disease.

Communicate initial actions to NPS, DOI, and, in conjunction with cooperators and in accordance with the DOI Pandemic Influenza Plan, to the media. If HPAI H5N1 is confirmed, implement the full response plan.
MEASURED RESPONSE: YOUR PARK IS IN A DISEASE SURVEILLANCE ZONE

DEFINITION: The park is within the boundaries of a USDA-defined Surveillance Zone but not within the Control Area of a confirmed case of HPAI. The Control Area includes the Infected Zone and Buffer-Surveillance Zone and extends in a radius beyond the affected premises. The Surveillance Zone surrounds the Control Area.

CONSIDERATIONS: Park managers are encouraged to implement a measured response based on the park's assessment of potential disease transmission from the Infected Zone of a confirmed HPAI case. The state veterinarian or APHIS could request parks located within a Surveillance Zone to implement the state’s response plan. Park staff should consider these requests based on the NPS mission, park enabling legislation, other applicable policy, and this Response Plan.

RECOMMENDED ACTIONS

STEP 4: Contact cooperating agencies and organizations.

Contact the appropriate agencies, organizations, or entities (Appendix 5). As part of the Preparedness and Communication Plan, park units have previously identified resources at risk, developed an appropriate contact list specific to their park (Appendix 5), and made introductory notifications to individuals.

Depending on park unit resources at risk, five broad categories may guide the minimum level of contacts that need to be initiated (Table 1).

<table>
<thead>
<tr>
<th>Resources at risk</th>
<th>Recommended minimum level of contact</th>
</tr>
</thead>
<tbody>
<tr>
<td>No poultry/domestic fowl, wildlife, cultural, or visitor resources/human health at risk</td>
<td>No additional contact needed.</td>
</tr>
<tr>
<td>No poultry/domestic fowl, wildlife, or cultural resources at risk but visitor activities/human health at risk</td>
<td>Contact appropriate park, regional, and WASO personnel, including Public Health Program and Risk Management, State Veterinarian, and AVIC for potential closures</td>
</tr>
<tr>
<td>Cultural resources at risk plus one or more of the following: poultry/domestic fowl, wildlife, or visitor activities/human health.</td>
<td>Contact appropriate park, regional, and WASO personnel, State Veterinarian, AVIC, and State Historic Preservation Office (SHPO).</td>
</tr>
<tr>
<td>Poultry/domestic fowl at risk plus possibly one or more of the following: wildlife, cultural, or visitor activities.</td>
<td>Contact appropriate park, regional, and WASO personnel, including BRMD Wildlife Health Program, State Veterinarian, and AVIC. Additional agencies or entities as needed.</td>
</tr>
<tr>
<td>Wildlife at risk plus possibly one or more of the following: poultry/domestic fowl, cultural resources, visitor activities/human health.</td>
<td>Contact park, regional, and WASO personnel, including BRMD Wildlife Health Program, State Veterinarian, AVIC, state wildlife agency contact, and additional agencies or entities.</td>
</tr>
</tbody>
</table>
STEP 5: Conduct a situation analysis, including incident complexity, and order incident resources as needed.

A. Gather as many facts about the incident as possible, using the Situation Analysis form (Appendix 4). Be sure to consider the potential and forecasted effects. Ask yourself, what could happen, as well as what is likely to happen, in the next two weeks? The next month?

B. Use the “Factors” column on the Incident Complexity Guide form (Appendix 4) to review the facts from the Situation Analysis.

C. Contact your regional incident management coordinator and discuss the situation. Include type 2 or type 1 incident commanders in the decision process, as appropriate.

D. Looking at the typical characteristics of each factor, decide which of the characteristics listed under the “type” columns best describes your incident. Remember, no single incident will have all of the factors under just one of the “type” columns.

E. Determine the complexity based upon the preponderance of factor characteristics identified. See the instructions for the Complexity Guide.

F. Order incident management team resources as needed. One of the benefits of the Incident Command System is that if the situation changes, you can always transition to a more complex or less complex management structure. You should place the orders through your local or zone dispatch center (same system that is used to order fire resources).

G. If a full Incident Management Team is not necessary, consider ordering assistance from subject matter experts in wildlife health, wildlife management, public affairs, public health, and risk management. If an Incident Management Team is not available (e.g., due to multiple outbreaks) consider pooling resources within a Region, or among area parks, and using templates of HPAI information developed by other parks.

STEP 6: Review existing plans and policy documents.

A. Review the plans and policy documents applicable to the management of your park. These may include:
   - Enabling legislation
   - Park Strategic Plan
   - Resource Management Plan
   - General Management Plan
   - Concessions Plans, Agreements and Contracts
   - Visitor Service Plans
• Compliance Policies
• Land Protection Plans
• Cooperative Agreements

B. Consult with your park’s legal, policy, and technical experts to determine the appropriate management approach to the situation. Ultimately, however, consultation between the Secretaries of Agriculture and the Interior under the Animal Health Protection Act may assign disease management authority.

**STEP 7: Take actions in coordination with cooperating agencies.**

A. Work with cooperating agencies to determine the appropriate actions. Note that there are no data to suggest that culling migratory birds is an effective means to control HPAI. Neither the World Health Organization or the Food and Agriculture Organization of the United Nations recommend culling migratory birds to manage HPAI.

B. Potential objectives.

• Control spread of highly pathogenic avian influenza.
• Provide for the safety of the public, agency and incident personnel.
• Minimize negative impacts to private and public property, resources, recreation, businesses, and individuals.
• Provide accurate and timely information to agency and incident personnel and the public.
• Keep costs commensurate with incident needs.

C. Potential strategies.

• Provide education to workers, residents and the public.
• Implement health monitoring of wildlife responders.
• Enact USDA-defined Control Areas or Surveillance Zones.
• Eliminate or enclose poultry and domestic fowl in disease zones.
• Control feral and non-native species in or near disease zones.
• Limit the movement of animals in or near disease zones.
• Vaccinate birds in or near the disease zones (likely limited to T&E species).
• Reduce artificial concentrations of wild birds in disease zones.
• Continue or expand surveillance for HPAI in wild birds, and high risk mammalian species.

Refer to the “Sample Incident Objectives and Strategies” (Appendix 4) for more complete information and management approaches.
FULL RESPONSE: YOUR PARK IS IN A DISEASE CONTROL AREA

**DEFINITION:** The park is within the boundaries of a USDA-defined Control Area, i.e., when HPAI H5N1 is confirmed within park boundaries or a part of the park falls within an Infected Zone or Buffer-Surveillance Zone from a case outside the park.

**CONSIDERATIONS:** The state veterinarian or APHIS could request the park located within a Control Area to implement the state’s response plan. Park staff should consider these requests based on the NPS mission, park enabling legislation, other applicable policy, and this Response Plan.

RECOMMENDED ACTIONS

**STEP 8: Notify cooperating agencies and organizations.**

Contact the appropriate agencies, organizations, or entities (Appendix 5). As part of the Preparedness and Communication Plan, park units have previously identified resources at risk, developed an appropriate contact list specific to their park (Appendix 5), and made introductory notifications to individuals.

Depending on park unit resources at risk, five broad categories may guide the minimum level of contacts to initiate (Table 2). Minimal contacts should include the park, regional, and WASO HPAI coordinators, state veterinarians, and APHIS AVIC. The park HPAI coordinators may recommend additional contacts depending on discussions with a park staff and a park unit’s visitor and resource situation.

**Table 2. Categories guiding contacts with other agencies and organizations.**

<table>

</tbody>
</table>
STEP 9: Conduct a situation analysis, including incident complexity, and order incident resources, including an Incident Management Team if needed.

A. Gather as many facts about the incident as possible, using the Situation Analysis form (Appendix 4). Be sure to consider the potential and forecasted effects. Ask yourself, what could happen, as well as what is likely to happen, in the next two weeks? The next month?

B. Use the “Factors” column on the Incident Complexity Guide form (Appendix 4) to review the facts from the Situation Analysis.

C. Contact your regional incident management coordinator and discuss the situation. Include type 2 or type 1 incident commanders in the decision process, as appropriate.

D. Looking at the typical characteristics of each factor, decide which of the characteristics listed under the “type” columns best describes your incident. Remember, no single incident will have all of the factors under just one of the “type” columns.

E. Determine the complexity based upon the preponderance of factor characteristics identified. See the instructions for the Complexity Guide.

F. Order incident management team resources as needed. One of the benefits of the Incident Command System is that if the situation changes, you can always transition to a more complex or less complex management structure. You should place the orders through your local or zone dispatch center (same system that is used to order fire resources).

G. If an Incident Management Team is not necessary, consider ordering assistance from subject matter experts in wildlife health, wildlife management, public affairs, public health, and risk management. If an Incident Management Team is not available (e.g., due to multiple outbreaks) consider pooling resources within a Region, or among area parks, and using templates of HPAI information developed by other parks.

STEP 10: Take initial containment actions in coordination with cooperating agencies.

A. Work with cooperating agencies to determine the appropriate actions. Note that there are no data to suggest that culling migratory birds is an effective means to control HPAI. Neither the World Health Organization or the Food and Agriculture Organization of the United Nations recommend culling migratory birds to manage HPAI.

B. Potential objectives.
   - Control and/or eradicate this outbreak of highly pathogenic avian influenza.
• Provide for the safety of the public, agency and incident personnel.
• Minimize negative impacts to private and public property, resources, recreation, businesses, and individuals.
• Provide accurate and timely information to agency and incident personnel and the public.
• Keep costs commensurate with incident needs.

C. Potential strategies.

• Provide education to workers, residents and the public.
• Implement health monitoring of wildlife responders.
• Establish infected and surveillance/movement control zones.
• Eliminate or enclose poultry and domestic fowl in disease zones.
• Control feral and non-native species in or near disease zones.
• Close areas in or near the established disease zones.
• Restrict human travel, activities and uses in or near disease zones.
• Limit the movement of animals in or near disease zones.
• Require the decontamination of humans, equipment and other property being used in management actions in disease zones.
• Vaccinate birds in or near the disease zones (likely limited to T&E species).
• Reduce artificial concentrations of wild birds in disease zones.
• Continue or expand surveillance for HPAI in wild birds, and high risk mammalian species.

Refer to the “Sample Incident Objectives and Strategies” (Appendix 4) for more complete information and management approaches.

**STEP 11: Manage the incident in accordance with law, policy, and management goals.**

A. Review the plans and policy documents that are applicable to the management of your park. These may include:

• Enabling legislation
• Park Strategic Plan
• Resource Management Plan
• General Management Plan
• Concessions Plans, Agreements and Contracts
• Visitor Service Plans
• Compliance Policies
• Land Protection Plans
• Cooperative Agreements

• Consult with legal, policy, and technical experts to determine your park’s appropriate management approach to the situation. Ultimately, however, consultation between
the Secretaries of Agriculture and the Interior under the Animal Health Protection Act may assign disease management authority.

B. Complete a written Delegation of Authority for the incoming Incident Commander (see sample, Appendix 4). Be sure to include all critical policy and management considerations in the document. NOTE: This plan recommends managing an outbreak incident under unified command with the other agencies (such as APHIS) and the sample delegation is written from that perspective. However, if other agencies do not wish to operate under unified command, the delegation should be rewritten to reflect only NPS interests.

C. The Agency Administrator (Park Superintendent) and the initial Incident Commander (IC) should brief the incoming IC or Incident Management Team (IMT). The Superintendent’s briefing should focus on management considerations. The initial IC’s briefing would normally be more concerned with field issues.

D. Park staff should work with the IMT to properly manage the incident. Additional materials that can assist incident management personnel are provided in Appendix 4 of this plan.
APPENDIX 1 - Surveillance for Highly Pathogenic Avian Influenza Subtype H5N1

Surveillance Strategies

Five strategies for collecting monitoring and surveillance data on Asian H5N1 virus in wild birds have been suggested (See An Early Detection System for Asian H5N1 Highly Pathogenic Avian Influenza in Wild Migratory Birds—U.S. Interagency Strategic Plan). The NPS is implementing investigation of morbidity and mortality events, at minimum. Determination of necessity for implementation of other surveillance strategies may be made on a site-specific basis.

Investigation of Morbidity/Mortality Events

Over 40 species of wild birds have been shown to be susceptible to infection with Asian H5N1 virus. While not all species infected necessarily exhibit disease, the current strain(s) of H5N1 circulating in Asia have been shown to cause morbidity and mortality in a wide variety of these species. The systematic investigation of morbidity and mortality events in wild birds to determine if Asian H5N1 is playing a role in causing illness and death offers the highest and earliest probability of detecting the virus if it is introduced by migratory birds into the United States. State natural resource agencies and Federal refuges and parks, primarily within the DOI’s U.S. Fish and Wildlife Service National Wildlife Refuge System and the National Park Service, are the principal authorities in a position to detect and respond to mortality events involving wild birds. Morbidity and mortality events involving wildlife are often detected by, or reported to, these agencies and entities. This strategy capitalizes on an existing morbidity/mortality program being conducted by DOI and its partners.

Surveillance in Live Wild Birds

This strategy incorporates sampling of live-captured, apparently healthy wild birds to detect the presence of Asian H5N1 virus. This effort will select bird species in North America that represent the highest risk of being exposed to, or infected with, Asian H5N1 virus because of their migratory movement patterns, which include birds that migrate directly between Asia and North America, or birds that may be in contact with species from areas in Asia with reported outbreaks. Should Asian H5N1 virus be detected in domestic birds in the U.S., sampling of wild birds in the flyway in the affected area may become a high priority as well. Data collected by organizations currently conducting research and monitoring for avian influenza in Alaska will be incorporated with additional bird captures as necessary to provide a broad species and geographic surveillance effort. This strategy capitalizes on research activities currently being conducted by DOI, USDA and their partners.

Surveillance in Hunter-killed Birds

Check stations for waterfowl hunting are operated by the US Fish and Wildlife Service and state natural resource agencies. Hunter check stations provide an opportunity to collect additional samples to determine the presence of HPAI and other subtypes of avian influenza viruses and supplement data collected during surveillance of live wild birds. As with surveillance of live wild birds, sampling of hunter-killed birds will focus on hunted species that are most likely to be exposed to HPAI in Asia; have relatively direct
migratory pathways from those areas to the U.S. via Alaska or directly to the Pacific Coast; mix in Alaska staging areas with species that could bring the virus from Asia; or should HPAI be detected in domestic birds in the U.S., may mix with wild birds in the flyway of the affected area. Collection of samples from these species will occur at hunter check stations in the lower 48 states during hunting seasons in areas where these birds stage during migration or over-wintering.

Sentinel Species

Waterfowl, exhibition gamefowl, and poultry flocks reared on backyard premises have been used as sentinels for active surveillance for avian diseases of interest to the commercial poultry industry and regulatory agencies. Currently in Alaska, the State veterinarian uses targeted surveillance of domestic flocks at concentration points due to remote location of villages and lack of resources; enthusiasts travel to poultry exhibitions with birds from distant locations; and surveillance effectively covers a large geographic area. Enhancement of this approach would be valuable. However, placement of sentinel ducks in strategic locations may also prove useful. Placement of sentinel ducks has been used successfully for surveillance of diseases of importance to the poultry industry, including influenza A. Also, sentinel ducks in wild pelagic bird colonies improved virus detection rates fivefold, suggesting that this approach is advantageous in ecological studies.

Environmental Sampling

Avian influenza viruses are generally released by waterfowl through the intestinal tract and viable virus can be detected in both feces and the water in which the birds swim, defecate and feed. This is the principal means of virus spread to new avian hosts and potentially to poultry, other livestock, and humans. Analysis of both water and fecal material from waterfowl habitat can provide evidence of AI circulating in wild bird populations, the specific AI subtypes, levels of pathogenicity, and possible risks to humans and livestock. Monitoring of water and/or fecal samples gathered from waterfowl habitat is a reasonably cost effective, technologically achievable means to assess risks to humans and poultry.

Priority Species

The table below lists suggested priority species for surveillance as reported in the Early Detection System for Asian H5N1 Highly Pathogenic Avian Influenza in Wild Migratory Birds—U.S. Interagency Strategic Plan.

APPENDIX 2. Protecting Employees and Visitors Against Exposure to HPAI H5N1.

Our protective strategy is to minimize exposure to virus through strict adherence to sanitation and personal hygiene practices and to create barriers that will isolate us from the source of virus. What specific personal protective ensemble should be worn and what work practices should be followed will depend on circumstances and the nature of your activities.

1. Sanitation and personal hygiene measures for preventing the spread of infectious disease:
   1. All employees should practice sanitation and personal hygiene measures to lessen the spread of infectious disease. These measures include proper hand washing, cleaning and sanitizing our tools and work areas, and cough etiquette.

   Personal Hygiene and Hand Washing.

   All employees should be educated about the importance of hand washing in controlling disease transmission. Hands should be washed for 10-15 seconds after contact with contaminated surfaces, after
sneezing, using the bathroom, handling garbage, contact with wildlife, soils and similar activities, and before preparing or eating food, smoking, drinking, applying cosmetics, lip balms, or lotions. The idea here is to disrupt the direct connection between a source of contamination and your vulnerable mucous membranes (eyes, nose, or mouth).

Proper hand washing means:
- First wet your hands and apply liquid or clean bar soap. Place the bar soap on a rack and allow it to drain.
- Next rub your hands vigorously together and scrub all surfaces.
- Continue for 10 - 15 seconds. It is the soap combined with the scrubbing action that helps dislodge and remove germs.
- Rinse well and dry your hands.

Alcohol sanitizing hand rubs or sanitizing cloths may be used as a temporary solution when hand washing facilities are not available. Portable field hand washing facilities are easily rigged and transported.

Always wash your hands after removing protective gloves.

Cleaning and Sanitizing.

Keep tools and work areas free of virus contamination. Surfaces should be cleaned with detergent and water and then sanitized.

Useful sanitizing solutions include:

- 1% solution of household bleach (5.25% sodium hypochlorite stock solution) for hard, non-porous surfaces. Use 1.25 oz or about 8 teaspoons regular household bleach in one gallon of water. Note: Bleach is corrosive to metal surfaces and if used should be rinsed.
- 5% solution of household bleach (5.25% sodium hypochlorite stock solution) for porous surfaces. Use 6.5 oz regular household bleach in one gallon of water. Note: Bleach is corrosive to metal surfaces and if used should be rinsed.
- 5% hospital-grade Lysol®
- other EPA-approved disinfectants

Cough and Sneeze Etiquette.

This measure will become critically important if HPAI develops sustained human to human transmission through droplet transmission. Cough etiquette procedures should be practiced to limit the spread of colds and seasonal influenza and to create good hygiene habits.

- Cover your mouth and nose with a tissue when you cough or sneeze, or cough or sneeze into your upper sleeve, not you hands. This limits the dispersal of infectious droplets in the air.
- Put the used tissue in the waste basket
- Clean your hands with soap and water or with an alcohol-based hand cleaner. This will decrease the spread of germs from hands and surfaces.

2. General precautions for preventing the spread of infectious animal diseases:

Whenever employees handle animals or work around them or become intimate with their habitat they should follow these General Precautions for preventing the spread of infectious animal diseases:

- Do not eat, drink or smoke, or any other activity which puts your hands in or near your eyes, nose or mouth while handling animals and until you can wash your hands.
- Avoid unnecessary contact with animals or animal tissue.
- Provide barriers to exposure such as gloves, goggles, or aprons. Specific recommendations for barriers are provided in section 3, below.
- Wash hands after contact with animals or contaminated surfaces.
- Obtain standard vaccinations, including vaccination for seasonal influenza.
The strategy of avoidance, spatial isolation, barriers, and hygiene also applies to park visitors, the public, and employees that do not (or should not) have direct contact with wildlife. For this group precautions should be emphasized in this way:

- Observe wildlife, including wild birds, from a distance. This protects you from the possible exposure to pathogens and minimizes disturbance to the animal.
- Avoid touching wildlife. If there is contact with wildlife, do not rub your eyes, eat, drink, or smoke before washing your hands with soap and water.
- **Do not pick up diseased of dead wildlife.** If a sick or dead animal is found, contact the park wildlife resources manager or a park ranger.

### 3. Task-Specific Work Practices

Some of activities will put workers in direct contact with wildlife. When this occurs you must follow protective measure geared specifically to your task and the exposure risk it creates.

<table>
<thead>
<tr>
<th>Low Risk Activities</th>
<th>HPAI is not known to occur in North America.</th>
</tr>
</thead>
<tbody>
<tr>
<td>While absence of HPAI in North America suggests a low risk, the following recommendations (based on USGS bulletin at <a href="http://www.nwhc.usgs.gov/publications/wildlife_health_bulletins/WHB_05_03.jsp">http://www.nwhc.usgs.gov/publications/wildlife_health_bulletins/WHB_05_03.jsp</a>) should be followed for use of personal protective clothing which provides barriers and isolates the worker from possible sources of disease causing organisms in general and safe work practices which emphasize hygiene and sanitation.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>If I am a…</th>
<th>…and my activities require me to…</th>
<th>…I should wear this Personal Protective Ensemble (PPE)…</th>
<th>…and follow these Safe Work Practices…</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hunter or Subsistence User</td>
<td>handle and prepare game</td>
<td>• Rubber, pvc, nitrile, or latex* gloves. Reusable gloves must be disinfected after use. • Goggles or a face shield is recommended while processing game.</td>
<td>• Do not handle or eat sick game. • Wash hands after handling animals • Thoroughly clean and disinfect knives, equipment, work surfaces and PPE that come in contact with game. • Cook game well done or to an internal temperature of at least 160° F).</td>
</tr>
<tr>
<td>Biologist or Ranger</td>
<td>handle apparently healthy wild birds</td>
<td>• Rubber, pvc, nitrile, or latex gloves.</td>
<td>• Work in well-ventilated areas if working indoors. • Disinfect work surfaces and equipment between sites and when tasks are complete. • Wash hands after handling animals</td>
</tr>
<tr>
<td>Biologist or Ranger</td>
<td>handle sick or dead birds or tissue associated with an unusual mortality event</td>
<td>• Rubber, pvc, nitrile, or latex gloves. • Goggles • NIOSH approved particulate respirator, N95 or better. • Coveralls, • Rubber boots or boot covers</td>
<td>• Work in well-ventilated areas if working indoors. • Disinfect work surfaces and equipment between sites and when tasks are complete. • Properly dispose of potentially infectious material including carcasses. • Wash hands after handling animals</td>
</tr>
</tbody>
</table>

*Caution: For some workers, contact with latex can result in allergic reactions.
Increasing Risk Activities. HPAI occurs in North America or migratory birds have arrived via flyways from affected areas or you work with wild birds in areas where HPAI has been detected.

Once HPAI occurs in North America or migratory birds have arrived via flyways from affected areas or you work with wild birds in areas where HPAI has been detected, your risk of exposure will increase and consequently, you must increase your protections.

<table>
<thead>
<tr>
<th>If I am a…</th>
<th>…and my activities require me to…</th>
<th>…I should wear this Personal Protective Ensemble (PPE)…</th>
<th>…and follow these Safe Work Practices…</th>
</tr>
</thead>
</table>
| **Hunter or Subsistence User** | handle and prepare game | • Rubber, pvc, nitrile, or latex gloves. Reusable gloves must be disinfected after use.

• Wash hands after handling animals  
• Thoroughly clean and disinfect knives, equipment, work surfaces and PPE that come in contact with game.  
• Cook game well done or to an internal temperature of at least 160°F. |
| **Biologist or Ranger** | handle apparently healthy wild birds | • Rubber, pvc, nitrile, or latex gloves. | • Work outdoors or in well-ventilated areas if working indoors.  
• Disinfect work surfaces and equipment between sites and when tasks are complete.  
• Wash hands after handling animals |
| **Biologist or Ranger** | handle sick or dead birds or tissue associated with an unusual mortality event | • Rubber, pvc, nitrile, or latex gloves.  
• Goggles  
• NIOSH approved particulate respirator, N95 or better.  
• Coveralls  
• Rubber boots or boot covers | • Work outdoors or in well-ventilated areas if working indoors.  
• Disinfect work surfaces and equipment between sites and when tasks are complete.  
• Properly dispose of potentially infectious tissues and carcasses.  
• Wash hands after handling animals  
• Monitor your health for clinical signs of influenza infection during and for one week after your last exposure to potentially HPAI virus-infected or exposed birds.  
• Contact your healthcare provider if you develop fever, flu-like symptoms or conjunctivitis and inform them prior to arrival that you have potentially been exposed to HPAI. |
| **Biologist, Public Health Officer, or other employee working with agricultural, public health or similar authority** | participate in animal disease control operations | • Rubber, pvc, nitrile, or latex gloves.  
• Goggles  
• NIOSH approved particulate respirator, N95 or better  
• Coveralls  
• Rubber boots or boot covers | • Work outdoors or in well-ventilated areas if working indoors.  
• Disinfect work surfaces and equipment between sites and when tasks are complete.  
• Properly dispose of potentially infectious tissues and carcasses.  
• Wash hands after handling animals  
• Receive an influenza antiviral drug daily for the duration of time during which direct contact with infected poultry or contaminated surfaces occurs.  
• Monitor your health for clinical signs of influenza infection during and for one week after your last exposure to potentially HPAI virus-infected or exposed birds.  
• Contact your healthcare provider if you develop fever, flu-like symptoms or conjunctivitis and inform them prior to arrival that you have potentially been exposed to HPAI. |

Caution: For some workers, contact with latex can result in allergic reactions.
You should note that once your activities place you at risk of exposure to HPAI, stringent barrier protections and strict adherence to hygiene and sanitation practices is required. For workers that are involved in handling dead or ill birds while investigating a mortality event where HPAI occurs, as well as for employees that may be directly involved in animal disease control operations such as culling domestic flocks, there are additional requirements for health care and health care monitoring. For these employees, daily antiviral medications are indicated. In addition, these employees should self monitor for symptoms of influenza infection for one week after their last exposure to potentially HPAI-infected birds. If symptoms are detected, employees should immediately contact their healthcare provider.

Special precautions are required for the laboratory personnel that will process wildlife samples. Their work will generally be conducted under Biosafety Level 3+ laboratory conditions.

<table>
<thead>
<tr>
<th>High Risk Activities</th>
<th>Sustained human to human transmission of HPAI occurs anywhere in the world.</th>
</tr>
</thead>
<tbody>
<tr>
<td>If sustained human to human transition occurs, our strategy of maintaining barriers and isolating ourselves from sources of infection and decreasing exposure potential through sanitation and hygiene will continue, but with emphasis on human to human rather than animal to human contact. Specific PPE and work practices for employees at high risk, such as emergency service providers, must be followed.</td>
<td></td>
</tr>
</tbody>

<td>• NIOSH approved particulate respirator, N95 or better  &lt;br&gt; • Use gloves and gown for all patient contact.  &lt;br&gt; • Goggles of face shields</td>
<td>• During periods of increased respiratory infection activity in the community offer masks to persons who are coughing.  &lt;br&gt; • When space permits, encourage coughing persons to sit at least three feet away from others.</td>
</tr>
<tr>
<td>Emergency Medical Services Provider, medical clinician, or Emergency Services Provider</td>
<td>Attend to or transport patients who present with fever and respiratory symptoms</td>
<td>• NIOSH approved particulate respirator, N95 or better  &lt;br&gt; • Use gloves and gown for all patient contact.  &lt;br&gt; • Goggles of face shields  &lt;br&gt; • Use dedicated equipment such as stethoscopes, disposable blood pressure cuffs, disposable thermometers, etc.</td>
<td>• Manage patients according to recommendations for Respiratory Hygiene and Cough Etiquette (<a href="http://www.cdc.gov/flu/professionals/infectioncontrol/resphygiene.htm">http://www.cdc.gov/flu/professionals/infectioncontrol/resphygiene.htm</a>) and question regarding their recent travel history.  &lt;br&gt; • Patients with a history of travel within 10 days to a country with avian influenza activity and are hospitalized with a severe febrile respiratory illness, or are otherwise under evaluation for avian influenza, should be managed using isolation precautions.  &lt;br&gt; • Practice Standard Precautions. Pay careful attention to hand hygiene before and after all patient contact or contact with items potentially contaminated with respiratory secretions.  &lt;br&gt; • Practice Droplet, Contact and Airborne Precautions.</td>
</tr>
</tbody>
</table>
4. Clinical Infection Control Measures

**Standard Precautions.** Use Standard Precautions, or the equivalent, for the care of all patients. A detailed discussion of these precautions can be found at [http://www.cdc.gov/ncidod/dhqp/gl_isolation_standard.html](http://www.cdc.gov/ncidod/dhqp/gl_isolation_standard.html). These precautions include:

- Hand washing
- Use of personal protective equipment including gloves, respirators, eye and face protection, and splash protection
- Patient care equipment
- Environmental control
- Laundry
- Specific infection control measures
- Patient placement

**Droplet Precautions and Airborne Precautions**

Droplet transmission involves contact of the conjunctivae or the mucous membranes of the nose or mouth of a susceptible person with large-particle droplets (larger than 5 µm in size). Droplets are generated from the source person primarily during coughing, sneezing, or talking and during the performance of certain procedures such as suctioning and bronchoscopy. Transmission via large-particle droplets requires close contact between source and recipient persons, because droplets do not remain suspended in the air and generally travel only short distances, usually 3 ft or less, through the air. Because droplets do not remain suspended in the air, special air handling and ventilation are not required to prevent droplet transmission. Droplet Precautions apply to any patient known or suspected to be infected with epidemiologically important pathogens that can be transmitted by infectious droplets. A detailed discussion of these precautions can be found at [http://www.cdc.gov/ncidod/dhqp/gl_isolation_droplet.html](http://www.cdc.gov/ncidod/dhqp/gl_isolation_droplet.html).

Airborne transmission occurs by dissemination of either airborne droplet nuclei (small-particle residue [5 µm or smaller in size] of evaporated droplets that may remain suspended in the air for long periods of time) or dust particles containing the infectious agent. Microorganisms carried in this manner can be dispersed widely by air currents and may become inhaled by or deposited on a susceptible host within the same room or over a longer distance from the source patient, depending on environmental factors; therefore, special air handling and ventilation are required to prevent airborne transmission. A detailed discussion of these precautions can be found at [http://www.cdc.gov/ncidod/dhqp/gl_isolation_airborne.html](http://www.cdc.gov/ncidod/dhqp/gl_isolation_airborne.html). Droplet and airborne precautions include:

- Patient placement and masking
- Use of respirators
- Patient transport

**Contact Precautions**

Direct-contact transmission involves skin-to-skin contact and physical transfer of virus to a susceptible host from an infected person. Indirect-contact transmission involves contact of a susceptible host with a contaminated intermediate object, usually inanimate, in the patient's environment. A detailed discussion of these precautions can be found at [http://www.cdc.gov/ncidod/dhqp/gl_isolation_contact.html](http://www.cdc.gov/ncidod/dhqp/gl_isolation_contact.html). These precautions include:

- Patient placement
- Use of gloves and hand washing
- Gowns
- Patient transport
- Patient-care equipment

**Surveillance and Monitoring of Workers**

Instruct workers to be vigilant for the development of fever, respiratory symptoms, and/or conjunctivitis (i.e., eye infections) for 1 week after last exposure to avian influenza-infected or exposed birds or to potentially avian influenza-contaminated environmental surfaces. Individuals who become ill should seek medical care and, prior to arrival, notify their health care provider that they may have been exposed to avian influenza. In addition, employees should notify their health and safety representative.

With the exception of visiting a health care provider, individuals who become ill should be advised to stay home until 24 hours after resolution of fever, unless an alternative diagnosis is established or diagnostic test results indicate the patient is not infected with influenza A virus. While at home, ill persons should practice good respiratory and hand hygiene to lower the risk of transmission of virus to others. For more information, visit CDC’s “Cover Your Cough” website at http://www.cdc.gov/flu/protect/covercough.htm.
Appendix 3. History Form and Sample Submission Information.

SPECIMEN HISTORY FORM

Please e-mail or FAX to USGS before shipping specimens. Also, please call your Field Investigation Team member.

Submitter’s name: ___________________________ Affiliation: ___________________________
Address: ___________________________ Telephone: ___________________________
E-mail: ___________________________

Date collected: ___________________________ Collector’s Name: ___________________________

Method of collection: [found dead, euthanized (describe method) etc.]

Species and Number Submitted, and Condition (chilled, frozen, preserved tissues, etc):

Specific die-off location: ___________________________
County: ___________________________ State: ___________________________ Latitude/longitude: ___________________________

Environmental factors: (Record conditions such as storms, precipitation, temperature changes, or other changes that may contribute to stress.)

Disease onset: (The best estimate of when the outbreak started.)

Species affected: (The diversity of species affected may provide clues to the disease involved.)

Age/sex: (Any selective mortality related to age and sex?)

Morbidity/mortality: (Ratio of sick animals to dead animals.)

Known dead: (Actual pickup figures.) Known sick: ___________________________

Estimated dead: (Consider removal by scavengers or other means.)

Clinical signs: (Any unusual behavior and physical appearance.)
Population at risk: (Number of animals in the area that could be exposed to the disease.)

Population movement: (Recent changes in the number of animals on the area and their source or destination, if known.)

Problem area description: (Land use, habitat types, and other distinctive features.)

Comments: (Additional information/observations that may be of value such as past occurrences of disease in area.)

PLEASE USE ADDITIONAL SHEETS AS NECESSARY.
INSTRUCTIONS FOR COLLECTION AND SHIPMENT OF AVIAN AND MAMMALIAN CARCASSES

Please follow these instructions for collecting and shipping carcasses to the National Wildlife Health Center (NWHC) to insure adequate and well preserved specimens, and compliance with Federal shipping regulations.

1. More than one disease may be affecting the population simultaneously. When possible, collection of both sick and freshly dead animals increases chances for detecting most diseases. Collect and ship specimens representative of all species and geographic areas.

Obtain good specimens for necropsy. Carcasses that are decomposed or scavenged are usually of limited diagnostic value. Ideally, one should collect a combination of freshly dead animals and animals that were euthanized after their behavior is observed and recorded.

2. Collect animals under the assumption that an infectious disease or toxin is involved and other animals may be at risk. Remember to protect yourself as some of these diseases and toxins are hazardous to humans.

Use rubber, vinyl, or nitrile gloves when picking up sick or dead animals. If you do not have gloves insert your hand into a plastic bag. Immediately attach a leg tag to each animal with the following information in pencil or waterproof ink:

- species
- date collected
- location (specific site, town, county, state)
- found dead or euthanized
- collector (name/address/phone)
- additional history on back of tag

Place each animal in a plastic bag, tie shut, then place inside a second bag and tie shut (more than one individually bagged animal can be placed in the second bag). This system of double bagging prevents cross-contamination of individual specimens and leaking shipping containers that can contaminate vehicle surfaces and handlers during transportation.

Tag the outside bag with number of animals and type, date collected, location, and name of collector. TAG, BAG, TAG

Contact the NWHC for assistance with collecting samples from animals that are too large to ship.

If you plan to collect animals, take along a cooler containing ice to immediately chill the carcass(s).
3. Ship animals in a hard sided plastic cooler or a styrofoam cooler placed in a cardboard box. Unprotected styrofoam coolers break into pieces during shipment. Stuff newspaper in any space between the sides of the box and cooler. A shipping container can be made by lining a cardboard box with at least 1-inch thick pieces of styrofoam. Hard sided (plastic) coolers and reusable coolant will be returned if labeled with your name and address in permanent ink.

Line either type of cooler with a large plastic bag and pack the individually bagged animal(s) in the cooler with enough blue ice or similar coolant to keep carcasses cold. Blue ice (hardware or department store) is preferred to bagged wet ice to avoid leaking during shipment. Do not use dry ice unless instructed to do so. Place crumpled newspaper or similar absorbent material in the cooler with the bagged carcasses to fill unused space, keep ice in contact with carcasses, provide insulation, and absorb any liquids. Tape cooler or box shut with strapping tape. Place a detailed history of the animal and circumstances associated with the mortality event in an envelope and tape to the outside of the cooler.

4. NWHC DOES NOT PAY FOR SHIPPING. Prior to shipping contact the laboratory at 608-270-2400. Ship specimens by one day (overnight) service from Monday through Wednesday to guarantee arrival at NWHC before the weekend. If specimens are fresh and need to be shipped on Thursday or Friday please call NWHC to make special arrangements.

Freezing and thawing can make isolation of some pathogens difficult and damage tissues needed for microscopic examination. The NWHC prefers unfrozen specimens if they can be sent usually within 24 hours of collection or death. We will provide guidance on when or if to freeze samples on a case-by-case basis. If you are in the field and cannot call or ship within 24-36 hours, freeze the animal(s).

5. Label coolers as follows:

National Wildlife Health Center
6006 Schroeder Road
Madison, WI 53711

In addition to the NWHC address, please write DIAGNOSTIC SPECIMENS -WILDLIFE in the lower left corner to cover federal shipping regulations and ensure delivery of coolers with specimens to our necropsy entrance. Also mark the package KEEP COLD. Please make a note of the track number in case packages are delayed.
Appendix 4. Prototype Incident Management Materials

The materials in this section are offered as samples, prototypes, and guidelines for the management of an HPAI incident. At the time of an actual incident, the Agency Administrator (usually the Superintendent or acting) would prepare the delegation of authority. The IMT would determine objectives, strategies, and tactics and resources.

Sample materials included:

- Highly Pathogenic Avian Influenza Situation Analysis form
- Incident Complexity Guide
- Sample delegation of authority
- Sample listing of incident objectives and strategies
- Sample incident information checklist and strategy
- Incident management considerations
- Sample Incident Action Plan
| Geographic Factors | | | |

Product of the National Park Service Incident Management Steering Committee • April, 2001
INSTRUCTIONS FOR USING THIS GUIDE

1. Gather as many facts about the incident as possible, using the “factors” column to help identify the information needed.

2. Contact your regional incident management coordinator and discuss the situation with her or him. Include type 2 or type 1 incident commanders in the decision process, as appropriate.

3. Looking at the typical characteristics of each factor, decide which of the characteristics listed under the “type” columns best describes your incident. Remember, usually no one incident will have all of the factors fall under just one of the “type” columns.

4. Determine the complexity based upon the column under which the preponderance of factor characteristics fall. For example, if most of the characteristics are best described by the type 2 column, then the incident is probably of type 2 complexity. But, also consider mitigating as well as aggravating circumstances. For example, an analysis of agency participation in the 2002 Olympics in Salt Lake City seemed to have a number of type 1 characteristics, such as international significance and world-wide media attention. However, further inspection of these factors showed that they were NOT an agency responsibility and should not force the incident to type 1. Conversely, the President’s three week vacation in Grand Teton National Park meant high-level political involvement with significant media attention over an extended period, driving an otherwise type 2 incident to type 1.

5. Order incident resources, including an Incident Management Team, if needed, accordingly. Remember, one of the benefits of the Incident Command System is that if you were wrong, or if the situation changes, you can always transition to a more complex or lower complex management structure as needed.

INFORMATION REGARDING INCIDENT TYPES

Type 5 incidents are relatively simple incidents that are usually handled by one resource. Examples:
- motor vehicle accident with no injuries investigated by a single police officer
- small grass fire extinguished by a single engine.

Type 4 incidents are those normally encountered by an agency or jurisdiction and are normally managed by the initial responding resources. Examples:
- multi-vehicle accident with injuries, handled by multiple resources.
- single-alarm working building fire.

Type 3 incidents are incidents that may require more resources in addition to those that initially responded and/or the timeframes for managing the incident are extended. (Some large parks may maintain organized type 3 Incident Management Teams.) Examples:
- lost person search extending over several operational periods.
- one-day dignitary visit.
- multiple alarm structural fire.

Type 2 incidents are incidents of significant complexity exhibiting characteristics shown by the factors listed on the reverse side of this sheet. These incidents are usually managed by regionally organized type 2 Incident Management Teams. Examples:
- impacts from moderate to large disaster, such as a hurricane, flood, tornado or earthquake.
- large special event or ceremony.

Type 1 incidents are the most complex incidents, often involving multiple kinds of activities, a large area of operation or significant political involvement. These incidents are usually managed by a nationally organized type 1 Incident Management Team. Examples:
- impacts from a large disaster, such as a hurricane, flood, tornado or earthquake.
- large special event or ceremony with national or international significance.
SAMPLE DELEGATION OF AUTHORITY

Memorandum

To: Incident Commander, NPS Incident Management Team

From: Superintendent, [name of park]

Subject: Delegation of Authority, Highly Pathogenic Avian Influenza Response

You are hereby assigned to manage the incident related to this outbreak of highly pathogenic avian influenza in (insert name of NPS Unit) ________________. You have full authority and responsibility for managing incident activities within the framework of law, regulation, Service and park policy, this Delegation, and guidance provided in the initial and subsequent briefings.

Specific direction and management considerations for this incident are:

1. For the safety of incident personnel and the public, identify hazards and assess and mitigate risks before taking actions.

2. Coordinate incident management, including priority setting, through Unified Command.

3. Protect private and public property and resources, basing actions on analysis of values at risk. Prevent, mitigate, or otherwise minimize resource impacts resulting from incident situations or operations.

4. Work with park staff to ensure that all incident operations are in compliance with all laws, regulations, and policies. Record and document plans and actions for Park’s historical archives.

5. Provide accurate and timely information to incident personnel, cooperating agencies and the public.

6. Keep costs commensurate with incident needs. Coordinate reimbursable costs with cooperating agencies as required. Develop a request for emergency funding and provide the necessary documentation. Coordinate finance with the Park administrative staff.

7. I appoint ______________________________ to serve as my Agency Advisor. She/He has full authority to make decisions in my stead. Park personnel may be assigned to the incident. Coordinate their availability with Agency Advisor.

8. Make all out-of-area resource orders directly with ________________ Dispatch.

9. Prepare a list, to be used for letters of appreciation, of any cooperative agencies, and their personnel that are assigned to the incident.

10. Ensure that as incident facilities are released back to the Park that they are cleaned and put back to good order. Work with the Park staff to refurbish any equipment and incident kits upon completion of their use.

11. Notify me 24 hours in advance of the closeout of your management of the incident.

12. Meet with me personally for a closeout meeting prior to your departure.

Superintendent,

Date
HIGHLY PATHOGENIC AVIAN INFLUENZA OUTBREAK

Sample Incident Objectives and Strategies

1. Control and/or eradicate this outbreak of highly pathogenic avian influenza, consistent with legislation and agency policies.

*Alternative strategies to evaluate. In most instances, multiple strategies will be employed simultaneously. In coordination with cooperating agencies, pick those strategies that best accomplish the objective while still complying with legal constraints, policy requirements and management goals:*

<table>
<thead>
<tr>
<th>Potential Strategy</th>
<th>Considerations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Provide education to workers, residents and the public.</td>
<td>• One of the most cost-effective, and most likely, strategies.</td>
</tr>
</tbody>
</table>
| 2. Identify the boundaries of and establish an Infected Zone, Buffer-Surveillance Zone, and Surveillance Zone. | • Actual zones will be established by APHIS.  
• APHIS may be willing to negotiate some aspects of the zones, especially toward the outer boundaries. |
| 3. Completely close all or part of either the Infected Zone or the Buffer-Surveillance Zone. | • Would have significant impacts on facilities, employees and residents in the closed area(s).   
• Could have significant impacts on the local tourist industry and retail trade |
| 4. Remove animal carcasses for sanitary disposal.                                  | • Pick up animal carcasses; euthanize moribund birds.  
• Identify sanitary and environmentally acceptable disposal methods. |
| 5. Exclude or eliminate poultry/domestic fowl in the Control Area and Surveillance Zones. | • Would have significant impacts on poultry/domestic fowl in the park and on cultural landscape scenes.  
• The most likely strategy to be used by APHIS. |
| 6. Control feral and non-native species in either the Control Area or the Surveillance Zone. | • May or may not meet legal or policy requirements and management goals for parks or state wildlife management agencies.  
• Consider bringing in expert assistance.  
• Could be operationally difficult to carry out. |
| 7. Continue or expand HPAI surveillance in wildlife.                               | • Consider including other surveillance strategies in addition to morbidity and mortality investigation.  
• Expand the number species monitored, including birds and mammals. |
| 8. Reduce or depopulate susceptible wildlife in either the Control Area or Surveillance Zone. | • Efficacy of culling migratory birds on HPAI control is not proven and not recommended by WHO or FAO.  
• May or may not meet legal or policy requirements.  
• Could have significant impacts on wildlife populations for years to come.  
• Consider other strategies or combinations of strategies to avoid this choice.  
• Could be operationally difficult to carry out. |
| 9. Limit the movement of animals in and around established zones.                  | • Could have significant impacts on the poultry/domestic fowl in the park.  
• An important component of any control strategy. |
| 10. Reduce artificial congregations of wild birds.                                 | • Prohibit feeding (except individual bird feeders)  
• Harvest agricultural crops on cultural landscapes.  
• Modify unnatural landscapes. |
| 11. Require the decontamination of humans, equipment and other property being moved out of the Control Area or the Surveillance Zone. | • May be used as a mitigating strategy to reduce the need for travel restrictions.  
• Will likely be required for incident personnel and equipment in affected areas. |
| 12. Vaccinate animals within the Control Area or other high risk areas.            | • Efficacy in wild birds is unknown. Consider bringing in expert assistance.  
• Operationally, this would be a very difficult strategy to carry out.  
• May be most appropriate for T&E species. |
13. Implement research

- Gain knowledge of HPAI in wild birds and effects of management actions.
- Gain knowledge on infection/impacts in mammals.

2. Provide for the safety of the public, agency and incident personnel.

   Strategies:

   - Develop protocols for providing for worker health, including follow-up monitoring, prophylaxis, and definition of exposure.
   - Implement active surveillance for HPAI in humans in the affected area.
   - Analyze all planned operational tactics and logistical arrangements to identify likely hazards and performance errors. Plan and implement actions to remove or mitigate the hazards and errors.
   - Use only standard or approved procedures for all activities.
   - Use only qualified personnel for specialized procedures and techniques.

3. Minimize negative impacts to private and public property, resources, recreation, businesses and individuals.

   Strategies:

   - Determine the types of unacceptable impacts.
   - Conduct an impact review of all planned actions. Analyze proposed operational tactics to identify impacts on property, natural and cultural resources, residents, visitors and other members of the public. Identify those actions that will result in unacceptable impacts and either alter the action or take mitigating steps to prevent the impacts.

4. Provide accurate and timely information to agency and incident personnel and the public.

   Strategies:

   - Develop and implement an Information Plan for target audiences.
   - Fulfill each request for information from other sources on a case-by-case basis.

5. Keep costs commensurate with incident needs.

   Strategies:

   - Use local resources to the extent possible.
   - Require Section Chief approval for all orders.
   - Provide instruction to incident personnel regarding proper ordering procedures.
   - Require that all personnel follow standard ICS ordering procedures.
   - Require justification for unusual or expensive requests.
SAMPLE INCIDENT INFORMATION CHECKLIST AND STRATEGY

Checklist:
Who is the lead agency for media and public communication? This will be determined at the national level. Provide support, or if appropriate, lead.

Is there a park Public Information/Public Affairs Officer or is it someone’s collateral duty? This person may have an existing information strategy and list of contacts, i.e. media, elected officials, key community members, neighboring agencies, etc.

If not, assign this role to a staff member who has experience dealing with the public. Even if a team comes in to manage the incident, having a park person available to work with the information function is invaluable as a source of local knowledge and it facilitates the dissemination of information to park staff and others.

Is there a website manager? This person will be a valuable asset to the incident.

Make a list of phone, fax numbers and/or email addresses of important contacts, i.e. concessioner representatives, elected officials, special interest groups, park partners, neighboring agencies and others who will want/need information and updates on situation. If a media contact list is not available, compile a list of the newspapers, TV and radio stations that serve the area surrounding the park.

Determine information center location(s) at the park, if appropriate facilities exist. Will park employees provide the staffing, or will additional resources need to be ordered?

Example of an information strategy:

Situation: brief statement on who, what, where, when
An outbreak of highly pathogenic avian influenza is occurring in or near the park. The NPS is activating its response plan, which provides options for actions to protect the park’s wildlife resources from further (or possible) infection.

Communication Objectives: measurable and attainable
Provide timely and updated information to the target audiences on the actions the park is taking related to the threat or presence of HPAI. This information can include press releases, community and park bulletin boards, public meetings, and information centers.

Target groups: who are you communicating with?
Park employees
Park concessioners, cooperating associations, other park partners
Incident management staff (if different from park staff)
Local residents in surrounding/gateway communities
Inholders
Visitors
Business permit holders
Cooperating agencies (APHIS, USGS BRD, public health service, US Fish and Wildlife Service, USDA Forest Service, state fish and game, state veterinarians, country sheriff, state highway patrol)
Elected officials
Special interest groups (environmental, animal rights, outfitters and guide association)
News media

Information Center Location:
Use park visitor center(s) or public information office, if possible. Otherwise establish center at Incident Command Post or appropriate location (needs to have access and phone lines). Consider how many information centers are needed (i.e., a center may be needed at each entrance).

Communication Methods: use as many as appropriate
Establish information centers to provide information in person or over the phone.

Establish information bulletin boards in areas utilized by park visitors and in local communities. Consider providing roving information staff in high use areas.

Provide information to local residents and businesses by distributing updates in person via door to door handouts.

Utilize existing park web site or create one for incident. Update daily or as situation changes.

Key Messages: significant points you want to get across
This disease affects birds, primarily waterfowl and shorebirds. The disease is of concern because of the potential impact on domestic poultry and the potential for human infection. The National Park Service is being proactive and prudent in preventing the disease from entering the park and/or assisting (working in cooperation with) other agencies with containment.

The wildlife resources of the National Park System are significant and protecting them is an integral portion of the agency's mission. Wildlife viewing is a major visitor activity in national parks and many parks provide habitat for endangered and threatened species.

At the same time, the NPS recognizes that the disease poses a threat to human health and a large-scale threat and economic harm to the poultry/domestic fowl and tourist industries.

A measured, rational response to the threat of HPAI is required so that impacts on the park and the surrounding area are appropriate to the degree of threat.
Monitor all types of media:
Check newspapers for coverage
Monitor TV and radio coverage
Feedback from employees, visitors, local residents, and officials
Information gathered from community/park contacts
Hits on web site

INCIDENT MANAGEMENT CONSIDERATIONS

Unified Command

- Definition: a command structure that provides for all agencies or individuals who have jurisdictional responsibility, either geographical or functional, to jointly manage an incident through a common set of objectives.
- In the case of highly pathogenic avian influenza in animals, the Animal and Plant Health Inspection Service (USDA APHIS) is the lead agency for national response to the disease. While the NPS must be responsive to the concerns of APHIS, a park does not give up its fundamental mission to protect park resources. NPS authority is not unquestioningly relinquished to APHIS; rather, planned actions should be jointly negotiated through a unified process. Ultimately, however, consultation between the Secretaries of Agriculture and the Interior under the Animal Health Protection Act may assign disease management authority.
- A park manager may delegate incident management to an Incident Management Team (IMT) or Unified Command by means of a signed Delegation of Authority.

Safety Officer

- Obtain briefings from APHIS and public health officials to understand hazards, risks, and mitigation strategies
- Be sure to inform all incident personnel of the true risk factors and required mitigation strategies involved in HPAI management
- Order enough Assistant Safety Officers to monitor logistical functions as well as operations in the field

Information Officer (refer to the Incident Information Checklist and Strategy)

Operations Section Chief

- Confer with local subject matter experts and the Situation Unit on current incident conditions (wildlife, humans, topography, access, road conditions).
- Many personnel may be new to ICS. Briefings on organization, chain-of-command, terms, ordering procedures may be required
- Maintain lines of communication to track the status of resources (human and supplies/equipment)
• Check on any upcoming events (festivals, hunting seasons, etc.) that may significantly impact the incident, the park unit, surrounding area, and neighboring communities
• Technical specialists, for example an NPS Disease Assistance and Response Team, may be assigned to Operations or Planning

Planning Section Chief

• Consider providing briefing packets in addition to the Incident Action Plan
• Field Observers may be very useful in locating and tracking wildlife
• Documentation will be extremely important. Consider preparing an Incident History for publication
• Technical specialists, for example an NPS Disease Assistance and Response Team, may be assigned to Operations or Planning

Logistics Section Chief

• Incident security is likely to be an Operations function although security for facilities and supplies/equipment caches may be required
• It is likely that area closures will require incident base facilities to be located a substantial distance from operational areas
• Multiple agencies will be involved and communications could be a significant challenge
• Consider ordering a technical specialist to manage disinfection and disposal
• Ground support may require a vehicles for moving carcasses
• Fencing materials may be required; a fencing crew may work for Logistics or Operations and need to coordinate with Resource Advisors

Finance Section Chief

• Comps/Claims issues may arise.
• Tort claims (Form SF-95) may arise from private citizens
• SEMA and FEMA may be involved
• Multiple agency involvement will result in complex accounting
• Prepare reimbursable accounts as needed
• Check for existing cooperative agreements

7. CONTROL OPERATIONS

- Restrict travel in the following areas:
- Conduct foot and horse patrols and post lookouts to prevent people from entering the infected area.
- Post closure signs at main access points.
- Observe domestic birds and wildlife and report information to the Operations Section Chief as appropriate.

8. SPECIAL INSTRUCTIONS

Division Supervisor will notify the Operations Section Chief of any breach of the closed area immediately. Ensure that biosafety/decontamination protocols are followed when moving from one area to another. Keep a supply of information packets available to distribute to the public as needed.

14. AIR OPERATIONS SUPPORT EQUIPMENT

15. PREPARED BY
   (Include Date & Time)
Highly Pathogenic Avian Influenza Outbreak

Safety Message

• STAY OUT of the Infected Zone unless you are specifically assigned to conduct tasks within that zone.

• Implement sanitation and personal hygiene measures to prevent the spread of disease—Wash your hands, clean and sanitize tools and work area.

• Always wear prescribed personal protective equipment.

• Be sure to drink plenty of fluids and work with your incident supervisor to schedule breaks in hot weather.

• There may be an unusual number of vehicles in the area. Watch yourself around traffic.

• Be aware of your surroundings at all times, especially when walking on or near roads with traffic moving!

• Watch your footing! You may encounter uneven surfaces, dense brush, uneven pavement, and stairs.

• Normal traffic patterns will be altered during the control of the disease. Stay alert!

• Ticks are numerous! Do a tick check after work, especially if your assignment was in wooded or grassy areas.

• Drive at speed limits and drive defensively.

• Consider other safety issues:
  Decontamination procedures; animal handling procedures and safety; aviation safety.

GLOSSARY

This glossary contains simple explanations of terms, as they can be understood in the context of the Highly Pathogenic Avian Influenza Preparedness and Communication Plan and Response Plan.

APHIS - Animal and Plant Health Inspection Service, part of USDA.

AVIC – Area Veterinarian-in-Charge. The lead veterinarian for USDA APHIS in a particular geographical area; there are 42 areas nationwide.

BRD – Biological Resources Division. A division of the U.S. Geological Survey based in Reston, VA but including the Wildlife Health Center in Madison, WI.

BRMD – Biological Resource Management Division. A division of the National Park Service, part of the Natural Resource Program Center, based in Fort Collins, CO.

Buffer-Surveillance Zone – Area designed by USDA APHIS. The zone immediately surrounding the Infected Zone is the Buffer-Surveillance Zone, which with the Infected Zone comprises the Control Area.

Case mortality rate – number of those infected who will die.

Control Area – Area designated by USDA APHIS that includes the Infected Zone and a Buffer-Surveillance Zone.

Culling – lethal removal of animals to control a disease outbreak.

Disinfectant – A chemical or mechanical means of rendering the virus unviable. For HPAI, bleach and appropriate quaternary ammonia compounds, peroxygens, and phenols used at proper concentrations.

FAO – Food and Agriculture Organization of the United Nations.

HHS – United States Department of Health and Human Services.

HPAI – Asian strain of highly pathogenic avian influenza subtype H5N1

HPAI Coordinator – A person designated in each NPS Unit to evaluate the vulnerability of the unit to HPAI, and to be aware of the NPS Preparedness and Communication Plan and Response Plan for the disease.

HPAI Regional Coordinator – a person appointed by the NPS Regional Director to help ensure that HPAI Preparedness and Communication Plan and Response Plan are coordinated between park units, the NPS Washington Office, and other appropriate agencies.

Incident Management Team (IMT) – The team has authority delegated by the Agency Administrator to take necessary actions to respond to a specific emergency.
Incident – An occurrence or event, either human-caused or natural phenomena that requires action by emergency service personnel to prevent or minimize loss of life or damage to property and/or natural resources. An HPAI outbreak (at least initial outbreaks) that affected NPS units would be handled as an incident.

Incident Action Plan (IAP) – The incident action plan, which is usually prepared at the first meeting, contains general control objectives reflecting the overall incident strategy, and specific action plans for the next operation period (incidents are divided into operational periods). The HPAI Response Plan includes an IAP.

Incident Commander – The individual responsible for all incident operations.

Incident Command System (ICS) – The combination of facilities, equipment, personnel, procedures, and communications operating within a common organizational structure with responsibility for the management of assigned resources to effectively accomplish stated objective pertaining to an incident.

Infected Zone – Area designated by USDA APHIS. In an outbreak, the Infected Zone initially will encompass the perimeter of all presumptive positive and confirmed positive premises and will include as many of the Contact Premises as the situation requires. The boundary of the Infected Zone initially should be established at least 10 km.

Morbidity - Illness apparent by clinical signs of disease

Mortality - Death

Pandemic – worldwide outbreak of disease

Pathogenicity – ability to cause disease. For avian influenza, the reference is for ability to cause disease in poultry.

State Veterinarian – State official that is responsible for livestock disease control to ensure compliance with federal and state laws.

Surveillance Zone – Area designated by USDA APHIS. A Surveillance Zone should be established within and along the border of a Free Zone, separating the Free Zone from the Buffer-Surveillance Zone within a Control Area.

T&E Species – Threatened and endangered species as designated by listing under the provisions of the Endangered Species Act.

Unusual mortality event – Identification of sick or dead wildlife that is outside of the limits of that routinely encountered.

USDA – United States Department of Agriculture. APHIS is a part of the Department of Agriculture.

USFWS – United States Fish and Wildlife Service.
WASO – NPS Washington D.C. Support Office

WHO – World Health Organization.
Contributors to Plan

Dr. Margaret Wild, Wildlife Veterinarian, Biological Resource Management Division. Margaret_Wild@nps.gov

CAPT. Chuck Higgins, U.S. Public Health Service, Director, NPS Office of Public Health. Charles_Higgins@nps.gov.

CAPT. David Bleicher, U.S. Public Health Service, NPS Occupational Health Program. David_P_Bleicher@partner.nps.gov.

Bob Palmer, Acting National Staff Ranger, Washington DC. Bob_Palmer@nps.gov.

Steve Krutz, Human Resource Specialist, Division of Labor and Employee Relations Steve_krutz@nps.gov.

Mark Harvey, Supervisory Park Ranger, Law Enforcement and Emergency Services Mark_harvey@ios.doi.gov

Administrative assistance was provided by Bridget Schuler, Jeremy Markuson, Robin Berg, and Debi Reep. Helpful comments on the draft were provided by numerous NPS parks, regions, and Washington D.C. office staff, and by the USGS National Wildlife Health Center and Parks Canada.
